Whats Happening Here?

This garden serves as a demonstration site during the growing season for varieties of vegetables that home gardeners might be interested in. We feature a variety of hybrid and heirloom varieties and in 2013 grew peas, brassicas, carrots, beets, lettuce, tomatoes, cucumbers, and perennials to attract beneficial insects.

Now, as Summer transitions to Fall and Winter, the garden will demonstrate a variety of strategies for maintaining soil health and retaining nutrients until the next growing season, including the use of cover cropping and mulching.
