Tool – Google Jamboard

Google's visual collaboration system, which includes both the Jamboard device and Jamboard apps, gives people who use G Suite (and their collaborators) the ability to create and modify Jams.

- A Jam is a persistent visual place that doesn't take up space.
- Each Jam consists of one--or many--rectangular frames filled with images, notes, or sketches.

Most Jamboard features are available in tablet apps. (See: 5 clever ways to use Google Jamboard tablet apps even without a Jamboard to learn more.) As of October 2018, a smaller set of features are available on the Jamboard smartphone apps for Android and iOS.

Jam in a browser
Create Jams, add notes, draw, and erase with Jamboard from the web.

- Sign in to Chrome or a Chromebook with your G Suite account, then go to https://jamboard.google.com.
- Select the + button in the lower-right portion of the screen to start a new Jam or open an existing Jam.
- With a Jam open, explore the controls on the left side of the screen to add, edit, or remove content on the board.
- You can create a Jam, add and edit notes, and draw and erase in Jamboard from the web.

Share view-only access
It's possible to add a collaborator to a Jam, but give them "view only" access.

- This allows a person to join a Jam, yet also prevents the person from modifying it.
- This allows you and your team of collaborators with full edit access to continue to make changes as people with "view only" access watch, but with no need to worry about changes from people with "view only" access.
- You might think of this as a virtual way to keep the dry erase markers out of the hands of specific people, while still letting them see your boards.
- Add a collaborator with view-only access, to allow them to access, but not modify, a Jam.
