When we build out interior spaces, whether as an adaptive reuse or new construction we must understand how interior elements interact with and connect to the structure and systems of the building and to one another.

This class builds on content covered in ARCH 4/570 Building Construction. We focus on Interior construction products and assemblies, building codes and regulations and allied trades and systems. Course content is explored through lectures, guided observation of new campus construction, exams, drawings and short design exercises.

This course is required for Interior Architecture students and is also recommended for architecture students who are earning a minor or specialization in Interior Architecture.
