“God is in the details”  
*Mies Van Der Rohe, architect*

But the devil is in the detail... conventional wisdom.

Details are most of times enough important, or significant, or critical, to integrate them since the first steps of our designs. Not only to solve rain or cold but also to gain a consolidation of our architectonics ideas.

After a few introductory lectures (material, technologies, assemblies...) the students have had time to develop the first ideas of their projects and discover their detailing interests. They will then do a research on them (precedents, study of alternatives ...) to finish a complete section of their architectural design.

Those who have chosen my design studio will develop their projects. Those in other studio will develop their projects in accordance with their instructors or other similar option.
