An Introduction to Chromatic Homotopy Theory

Part I : Spectra and Localization

Agnès Beaudry

May 14, 2019

Outline of the Course

- (I) Spectra and Localization
- (II) Complex Orientations and the Morava K -Theories *~ MU*
- (III) The Chromatic Filtration *~ Conjectures*
- (IV) Morava E -Theory and the Stabilizer Group *~ $K(n)$ -local*

Part I – Spectra and Localization

- (1) Cohomology Theories
 - (2) Spectra
 - (3) Stable Homotopy Category
 - (4) Bousfield Localization
 - (5) What is Chromatic Homotopy Theory? *↳ Motivation*
- Set-up.*

Cohomology with Coefficients in $G \in \text{Ab}$

Reduced

$$\widetilde{HG}^*(-): \text{CW}_+^{op} \rightarrow \text{Ab}$$

↑ based CW-complexes

- (Homotopy) If $f \simeq g$, then $\widetilde{HG}^*(f) = \widetilde{HG}^*(g)$.
- (Additivity)

$$\widetilde{HG}^*\left(\coprod_{i \in I} X_i\right) \cong \prod_{i \in I} \widetilde{HG}^*(X_i)$$

- (Exactness) For $A \subseteq X$ a subcomplex, the following sequence is exact:

$$\widetilde{HG}^*(X/A) \rightarrow \widetilde{HG}^*(X) \rightarrow \widetilde{HG}^*(A)$$

- (Suspension) For each n , there is a natural isomorphism

$$\widetilde{HG}^n(X) \xrightarrow{\cong} \widetilde{HG}^{n+1}(\Sigma X).$$

- (Dimension) $\widetilde{HG}^*(S^0) = G$ in $*$ = 0.

In fact, it is representable

$$\widetilde{HG}^n(X) \cong [X, K(G, n)], \quad K(G, n) \xrightarrow{\cong} \Omega K(G, n+1).$$

Eilenberg Mac Lane space

$$\pi_* K(G, n) = \begin{cases} G & \cdot = n \\ 0 & \cdot \neq n \end{cases}$$

Eilenberg-Steenrod Axioms

A *reduced cohomology theory* is a functor

$$\tilde{E}^* : CW_+^{op} \longrightarrow \text{Ab}$$

which satisfies the following axioms

1. (Homotopy) If $f \simeq g$ then $\tilde{E}^*(f) = \tilde{E}^*(g)$.
2. (Additivity)

$$\tilde{E}^* \left(\coprod_{i \in I} X_i \right) \cong \prod_{i \in I} \tilde{E}^*(X_i)$$

3. (Exactness) For $A \subseteq X$ a subcomplex, the following sequence is exact:

$$\tilde{E}^*(X/A) \rightarrow \tilde{E}^*(X) \rightarrow \tilde{E}^*(A)$$

4. (Suspension) For each n , there is a natural isomorphism

$$\tilde{E}^n(X) \xrightarrow{\cong} \tilde{E}^{n+1}(\Sigma X).$$

5. (Dimension) $\tilde{E}^*(S^0) = G$ in $*$ = 0. $\Rightarrow \tilde{H}G \cong \tilde{E}^*$

$$E^*(X) = \tilde{E}^*(X_+).$$

The Brown Representability Theorem

Let E be a cohomology theory. There is a sequence of based spaces E_n , $n \geq 0$ with weak equivalences

$$\omega_n: E_n \xrightarrow{\cong} \Omega E_{n+1}. \quad \leftarrow \text{suspension iso.}$$

such that

$$\tilde{E}^n(X) \cong [X, E_n].$$

The adjunction

$$\begin{array}{c} \text{Maps. } (S^1, Y) \\ \uparrow \\ [X, \Omega Y] \cong [\Sigma X, Y]. \end{array}$$

gives the suspension isomorphism

$$\uparrow \Sigma X \wedge S^1$$

$$\tilde{E}^n(X) \cong [X, E_n] \xrightarrow[\omega_n \circ -]{\cong} [X, \Omega E_{n+1}] \cong [\Sigma X, E_{n+1}] \cong \tilde{E}^{n+1}(\Sigma X)$$

The Category of Spectra Sp

Objects. An (Ω) -spectrum E is a sequence of based spaces E_n , $n \geq 0$ with weak equivalences

$$\omega_n: E_n \xrightarrow{\cong} \Omega E_{n+1}$$

Morphisms. A map of $f: E \rightarrow F$ is a sequence of maps $f_n: E_n \rightarrow F_n$ such that the diagram commutes:

$$\begin{array}{ccc} E_n & \xrightarrow{f_n} & F_n \\ \omega_n \downarrow & & \downarrow \omega_n \\ \Omega E_{n+1} & \xrightarrow{\Omega f_{n+1}} & \Omega F_{n+1} \end{array}$$

We denote the category of spectra by Sp .

Spectrification

For a sequence $E = \{E_n : n \geq 0\}$ and inclusions $\omega_n: E_n \hookrightarrow \Omega E_{n+1}$,

$$E_0 \hookrightarrow \Omega E_1 \hookrightarrow \Omega^2 E_2 \hookrightarrow \dots$$
$$\mathbb{L}E_n = \varinjlim_k \Omega^k E_{n+k}, \quad \mathbb{L}\omega_n = \varinjlim_k \Omega^k \omega_{n+k}$$

is a spectrum. This is called *spectrification*.

Ordinary Cohomology with Coefficients in G

$HG^*(-)$ is represented by

$$HG_n = K(G, n) \quad \omega_n: K(G, n) \xrightarrow{\cong} \Omega K(G, n+1).$$

Complex K -Theory

By Bott Periodicity, $\Omega U \simeq \mathbb{Z} \times BU$ and $\Omega(\mathbb{Z} \times BU) \simeq U$. Complex K -theory $K^*(-)$, is represented by

$$K = \{\mathbb{Z} \times BU, U, \mathbb{Z} \times BU, U, \mathbb{Z} \times BU, U, \dots\}.$$

Suspension Spectra

For a based space X , the *suspension spectrum* is the spectrification of

$$(\underline{\Sigma^\infty X})_n = \underline{\Sigma^n X} \quad \omega_n: \underline{\Sigma^n X} \rightarrow \underline{\Omega \Sigma^{n+1} X}$$

where ω_n is the adjoint to the identity

$$\sigma_n: \Sigma \Sigma^n X \xrightarrow{\cong} \Sigma^{n+1} X.$$

We often write X for $\Sigma^\infty X$. The *sphere spectrum* is $S^0 = \Sigma^\infty S^0$.

Complex Cobordism

MU is the spectrification of the sequence

$$\mathbb{N} \quad \{ \underline{MU}(1), \underline{\Sigma MU}(1), \underline{MU}(2), \underline{\Sigma MU}(2), \dots \}$$

where $MU(n)$ is the Thom space of the canonical complex vector bundle

$$\begin{array}{c} \uparrow \\ \gamma_n \rightarrow \underbrace{Gr_n(\mathbb{C}^\infty)}_{\uparrow} \simeq \underline{BU}(n). \end{array}$$

Note:

$$\begin{array}{ccc} i^* \gamma_{n+1} \cong \gamma_n \oplus \mathbb{C} & \xrightarrow{\quad} & \gamma_{n+1} \\ \downarrow & \swarrow \mathbb{R}^2 & \downarrow \\ \underline{BU}(n) & \xrightarrow{i} & \underline{BU}(n+1) \end{array}$$

The map $\omega_{2n+1}: \underline{\Sigma MU}(n) \rightarrow \underline{\Sigma MU}(2n)$ is adjoint to:

$$\underline{\Sigma^2 MU}(n) \cong Th(i^* \gamma_{n+1}) \xrightarrow{\sigma_{2n+1}} Th(\gamma_{n+1}) = \underline{MU}(n+1)$$

The map $\omega_{2n}: \underline{MU}(n) \rightarrow \underline{\Omega \Sigma MU}(n)$ is adjoint to the identity.

$MU(\text{pt})$

Homotopy Groups

If E is a spectrum, then the r th homotopy group of \underline{E} is

$$\pi_r E = \varinjlim_n \pi_{r+n} E_n.$$

A map $f: E \rightarrow F$ is a weak equivalence if $\pi_* f$ is an isomorphism.

Examples

- ▶ The *stable homotopy groups of spheres* are

$$\pi_r^S = \pi_r \Sigma^\infty S^0 \cong \varinjlim_n \pi_{r+n} S^n.$$

- ▶ $\pi_* H\mathbb{A} \cong \mathbb{A}$ concentrated in $* = 0$. $\in S^2$

- ▶ $\pi_* K \cong \mathbb{Z}[\beta^{\pm 1}]$ for $\beta \in \pi_2 K = K(\mathbb{C}P^1)$ the Bott class, i.e.,

$$\pi_{2r} K = \mathbb{Z}\{\beta^r\}, \quad \pi_{2r+1} K = 0.$$

↪ has neg. homotopy

- ▶ $\pi_* MU \cong \mathbb{Z}[x_1, x_2, \dots]$ for $x_n \in \pi_{2n} MU$ related to $[\mathbb{C}P^n]$.

$$\pi_0 MU = \mathbb{Z}\{1\}, \quad \pi_1 MU = 0, \quad \pi_2 MU = \mathbb{Z}\{x_1\}, \quad \pi_4 MU = \mathbb{Z}\{x_1^2, x_2\}.$$

Homotopy Category

Let \mathcal{C} be a category and \mathcal{W} a subcategory such that

- All isomorphisms of \mathcal{C} are in \mathcal{W} ,
- If 2 out of 3 of $\{f, g, g \circ f\}$ are in \mathcal{W} , then so is the third.

The *homotopy category* of \mathcal{C} is a category $Ho(\mathcal{C}, \mathcal{W})$ and a functor
if it exists

$$\iota: \mathcal{C} \rightarrow Ho(\mathcal{C}, \mathcal{W})$$

such that, for $F: \mathcal{C} \rightarrow \mathcal{D}$ which maps \mathcal{W} to isomorphisms, there is

The diagram shows a commutative triangle. At the top left is the category \mathcal{C} , and at the top right is the category \mathcal{D} . A solid arrow labeled F points from \mathcal{C} to \mathcal{D} . Below \mathcal{C} is the homotopy category $Ho(\mathcal{C}, \mathcal{W})$. A solid arrow labeled ι points from \mathcal{C} down to $Ho(\mathcal{C}, \mathcal{W})$. A dotted arrow labeled $\exists! F_{\mathcal{W}}$ points from $Ho(\mathcal{C}, \mathcal{W})$ up to \mathcal{D} . A curved arrow labeled \cong points from the solid arrow F to the dotted arrow $\exists! F_{\mathcal{W}}$. The entire top part of the diagram (\mathcal{C} , \mathcal{D} , and F) is enclosed in a hand-drawn orange box.

such that $F \cong F_{\mathcal{W}} \circ \iota$.

Stable Homotopy Category

$\mathcal{SH} = Ho(Sp, \mathcal{W}_{S^0})$ for \mathcal{W}_{S^0} the weak equivalences is called the stable homotopy category. $\pi, iso.$ Margolis

▶ $[X, Y] := \mathcal{SH}(X, Y)$ are abelian groups

Ravenel FLU
Nilpotence...

→ Finite products and coproducts are equivalent in \mathcal{SH}

▶ Closed symmetric monoidal with unit S^0 :

$(X \wedge E)_n$ \wedge $SH \times SH \rightarrow SH$ $F(-, -): SH^{op} \times SH \rightarrow SH$

$X \wedge E_n$ \otimes $F(X \wedge Y, Z) \cong F(X, F(Y, Z))$

▶ Triangulated: $\Sigma: SH \rightarrow SH$ with
 Spectrify Margolis

$\Sigma X = X \wedge S^1$ $\Sigma^{-1} X = F(S^1, X) = \Omega X$

▶ Distinguished triangles

cofiber sequence

$X \xrightarrow{f} Y \rightarrow C_f \rightarrow \Sigma X$

where $C_f = Y \cup_f (X \wedge [0, 1])$ is the cofiber of f .

▶ Long exact sequences for $[-, Z]$ and $[Z, -]$. For example:

$\dots \rightarrow \pi_n X \rightarrow \pi_n Y \rightarrow \pi_n C_f \rightarrow \pi_{n-1} X \rightarrow \dots$

Models for Spectra

There are other choices $(\mathcal{C}, \mathcal{W})$ with $S\mathcal{H} = \text{Ho}(\mathcal{C}, \mathcal{W})$. In particular, there are closed symmetric monoidal models for Sp .

EKM \mathcal{S} -Module

Symmetric Spectra $\mathcal{S}\mathcal{S}$

Orthogonal Spectra

∞ -infinity cat of Spectra

Homology and Cohomology

If E is a spectrum, then E -homology is the functor $\tilde{E}_* : \mathcal{SH} \rightarrow \text{Ab}$

$$X \mapsto \tilde{E}_n(X) := \pi_n(E \wedge X)$$

and E -cohomology is the functor $E^* : \mathcal{SH}^{op} \rightarrow \text{Ab}$

$$X \mapsto \tilde{E}^n(X) := \pi_{-n}F(X, E) = [X, \Sigma^n E].$$

We let

$$E_n := \tilde{E}_n(S^0) = \pi_n E = \tilde{E}^{-n}(S^0) =: E^{-n}$$

Stable Homotopy Groups as a Homology Theory

For $E = S^0$, this gives:

$$\tilde{S}^0_*(X) = \pi_*(X)$$

Weak equivalences are \tilde{S}^0_* -isomorphisms and \mathcal{SH} is obtained from Sp by inverting these.

X space

$$\pi_*^S X = \text{colim}_{n \rightarrow r} \pi_n X$$

Bousfield Localization

A map $f: X \rightarrow Y$ is an E -equivalence if

$$\tilde{E}_*(f): \tilde{E}_*(X) \xrightarrow{\cong} \tilde{E}_*(Y)$$

Let $\mathcal{W}_E \subseteq Sp$ be the subcategory of E -equivalences and

$$SH_E := Ho(Sp, \mathcal{W}_E). \quad \text{"E-local"}$$

- ▶ X is E -acyclic if $\tilde{E}_*(X) = 0$.
- ▶ Y is E -local if $[X, Y] = 0$ when X is E -acyclic.

Bousfield

Let Sp_E be the full subcategory whose objects are E -local spectra. In fact:

$$SH_E \cong Ho(Sp_E, \mathcal{W} \cap Sp_E).$$

Exercise

A map $f: X \rightarrow Y$ in Sp_E is a weak equivalence iff it is an E -equivalence.

Universal Property of Localization

An E -localization is an E -equivalence $\eta: X \rightarrow L_E X$ for $L_E X \in Sp_E$. These exist and are unique in \underline{SH} : $\uparrow E. iso$

$$L_E: \underline{SH} \rightarrow \underline{SH} \cong \underline{SH}, \quad \eta: 1_{SH} \rightarrow L_E.$$

If $f: X \rightarrow Y$ with $Y \in Sp_E$, then

$$\begin{array}{ccc} X & \xrightarrow{f} & Y \\ \eta \downarrow & \nearrow f_E & \\ L_E X & & \end{array}$$

and f_E is unique in \underline{SH} . There is a distinguished triangle

$$C_E X \rightarrow X \rightarrow L_E X \rightarrow \Sigma C_E X$$

\uparrow initial

where $C_E X$ is the terminal E_* -acyclic spectrum with a map to X .

Exercise

There is a natural transformation $L_{F \vee E} \rightarrow L_E$ and,
 "Ravenel" Nilpotence...
 Bousfield loc.

$$L_E \simeq L_E L_{E \vee F} \simeq L_{E \vee F} L_E.$$

Localization and Completion

For G an abelian group, let SG a Moore spectrum

$$\coprod_{j \in J} S^0\{r_j\} \longrightarrow \coprod_{i \in I} S^0\{g_i\} \longrightarrow SG \xrightarrow{\text{cofiber}} \Sigma \coprod_{j \in J} S^0\{r_j\}$$

for a presentation $\bigoplus_{j \in J} \mathbb{Z}\{r_j\} \rightarrow \bigoplus_{i \in I} \mathbb{Z}\{g_i\} \rightarrow G$.

- ▶ If $G = \mathbb{Z}_{(p)}$ or \mathbb{Q} , then $L_{SG}X \simeq SG \wedge X$ and

$$\pi_* L_{SG}X \simeq \pi_* X \otimes G.$$

The p -localization of X is:

$$X_{(p)} := L_{S\mathbb{Z}_{(p)}} X$$

The rationalization of X is:

$$X_{\mathbb{Q}} := L_{S\mathbb{Q}} X$$

- ▶ If the groups $\pi_* X$ are finitely generated, then

$$\longrightarrow \pi_* L_{S\mathbb{Z}/p} X \simeq \pi_* X \otimes \mathbb{Z}_p = \varprojlim_i \mathbb{Z}/p^i$$

Bousfield where \mathbb{Z}_p is the p -adic integers. The p -completion of X is

$$X_p := L_{S\mathbb{Z}/p} X.$$

The Sphere

For the p -local sphere $S_{(p)}^\bullet = L_{S\mathbb{Z}_{(p)}} S^\bullet$,

$$\pi_n S_{(p)}^\bullet \cong \begin{cases} \mathbb{Z}_{(p)} & n = 0 \\ \mathrm{Tor}_p(\pi_n^S) & n > 0. \end{cases}$$

$\mathbb{Z}_{(p)}$ S_p

For the rational sphere $S_{\mathbb{Q}}^\bullet = L_{S\mathbb{Q}} S^\bullet$,

$$\pi_n S_{\mathbb{Q}}^\bullet \cong \begin{cases} \mathbb{Q} & n = 0 \\ 0 & n > 0. \end{cases}$$

Connective Spectra

A spectrum is connective if $\pi_r X = 0$ for $r < 0$. For such X

$$L_{HG} X \simeq L_{SG} X.$$

$$S_p^\bullet = L_{H\mathbb{Z}_{(p)}} S^\bullet$$

Eilenberg MacLane

Adams Operations

For $k \geq 0$, there are *unstable* operations

$$\psi^k: K^*(X) \rightarrow K^*(X).$$

They give stable operations

Adams Blue Book

$$\psi^k: \underline{K}_p \rightarrow \underline{K}_p$$

for $k \in \mathbb{Z}_p^\times$ The action of ψ^k on $\pi_* K_p = \mathbb{Z}_p[\beta^{\pm 1}]$ is determined by

ring homo.
 \mathbb{Z}_p -algebra

$$\psi^k(\beta) = k\beta.$$

K-Theory Localization

Let p be odd and $K\mathbb{Z}/p = K \wedge S\mathbb{Z}/p$ so that

$$\pi_* K\mathbb{Z}/p \cong \mathbb{Z}/p[\beta^{\pm 1}].$$

Adams Baird
Ravenel
Bousfield

There is a distinguished triangle

$$\rightarrow L_{K\mathbb{Z}/p} S^0 \rightarrow K_p \xrightarrow{\psi^{\ell-1}} K_p \rightarrow \Sigma L_{K\mathbb{Z}/p} S^0$$

for ℓ a topological generator of $\mathbb{Z}_p^\times \cong C_{p-1} \rtimes \mathbb{Z}_p$

$$\pi_* L_{K\mathbb{Z}/p} S^0$$

Image of J

Real Bott Periodicity gives $\pi_{3+4k}O \cong \mathbb{Z}$. The J homomorphism

$$J: \pi_n O \rightarrow \pi_n^S$$

Hatcher Vector bundles

has image

n	3	7	11	15	19	23	27	31	35	39	43
	\mathbb{Z}_{24}	\mathbb{Z}_{240}	\mathbb{Z}_{504}	\mathbb{Z}_{480}	\mathbb{Z}_{264}	\mathbb{Z}_{65520}	\mathbb{Z}_{24}	\mathbb{Z}_{16320}	\mathbb{Z}_{28728}	\mathbb{Z}_{13200}	\mathbb{Z}_{552}

Exercise

Compute $\pi_* L_{K\mathbb{Z}/p} S^0$ and compare with the p -component of $\text{im}(J)$.

detects $\text{im}(J)$.

Next Time

Fix a prime p . There are spectra $K(0), K(1), K(2), \dots, K(\infty)$ called the Morava K -theories:

$$L_n X := L_{K(0) \vee \dots \vee K(n)} X$$

In fact,

$$L_{K(0)} \cong L_{H\mathbb{Q}} \quad L_{K(1)} \cong L_{K\mathbb{Z}/p} \quad L_{K(\infty)} \cong L_{H\mathbb{Z}/p}$$

The chromatic convergence theorem (Hopkins–Ravenel) states:

$$S_{(p)}^0 \cong \varinjlim_n L_n S^0$$

~~in SH.~~ The n th chromatic layer is $L_n S^0$.

Chromatic homotopy theory studies the $S_{(p)}^0$ via this filtration.
