Postdoctoral Research Opportunity:
Cell Death & Immunity

Oberst Lab
Dept. of Immunology
University of Washington
Seattle, WA, USA

The Oberst Lab at the University of Washington seeks a highly motivated postdoctoral researcher. The Oberst Lab is broadly interested in the intersection of programmed cell death and immunity, including **understanding cell death signaling pathways and their consequences**, as well as the creation of reagents to trigger **immunogenic cell death in tumors**. More recently, the lab’s interest has expanded to include non-death functions for the “necroptotic” pathway in **host defense and metabolic reprogramming in the brain** (for example see BP Daniels et al., *Cell* 2017, PMID 28366204). More info: oberstlab.org

The successful applicant will join a dynamic and well-funded research team. The Oberst Lab is located in the heart of beautiful Seattle, where team members enjoy the highly collaborative environment of the University of Washington’s Department of Immunology and the Seattle area’s thriving research community.

Applicants should have a Ph.D. in the biomedical sciences and a track record of producing and publishing high quality original research. Applicants are particularly sought with experience in areas complementary to the interests of the lab, including **cancer immunology, neuroimmunology, and cell death signaling**. CVs and inquiries should be sent to: oberstlab@gmail.com
