Supplementary: Predicting the visual attention of pathologists evaluating whole slide images of cancer

Souradeep Chakraborty, Rajarsi Gupta, Ke Ma, Darshana Govind, Pinaki Sarder, Won-Tak Choi, Waqas Mahmud, Eric Yee, Felicia Allard, Beatrice Knudsen, Gregory Zelinsky, Joel Saltz, and Dimitris Samaras

1 Additional attention heatmap prediction results

Fig. 1. Visualization of attention data from the GU specialist on 2 test WSIs of Prostate (rows 1 and 4). We compare the predicted attention heatmaps to the specialist-derived attention heatmap using the compared models (rows 2, 3, 5 and 6). PathAttFormer+SA best predicts the specialist-derived attention heatmap and the tumor segmentation.
Fig. 2. Visualization of attention data from a single pathologist on two test WSI instances of GI-NET. We also compare the predicted attention heatmaps to the pathologist-derived attention heatmap for the same WSI instances using the compared models (in rows 3 and 6). PathAttFormer + SA best predicts the pathologist-derived attention heatmap ($N = 2$) and the tumor segmentation mask.
